

ABSTRACT OF THE DISCLOSURE

The shape of a reflector is to be made conspicuous to improve the appearance of a headlamp assembly. A headlamp assembly includes electric bulbs, a reflector, a lens and a case. Between the reflector and the case are formed gaps which result from a difference in shape between the reflector and the case. Blindfold portions are formed integrally with the reflector for filling the gaps. The blindfold members are provided with reflecting surfaces which project a black portion of the ground or of an inner surface of the case. With the reflecting surfaces of the blindfold members, a contrast is created between the blindfold member and reflecting surfaces of the reflector to make the reflecting surface shape of the reflector conspicuous.
